My Contributions to Bexra

Role

Founder & Product Lead

I have been involved in Bexra across product planning, development, AI integration, testing, debugging, and technical decision-making.

My work has involved both defining what the product should do and implementing and validating technical features required to support those requirements.

Product & Technical Planning

I have contributed to:

- Defining product requirements and user workflows
- Planning feature architecture
- Breaking product requirements into technical tasks
- Designing user flows from onboarding to project execution
- Prioritizing product features
- Evaluating technical approaches and implementation trade-offs
- Testing features from both product and engineering perspectives

---

Frontend Development

I have worked on frontend functionality including:

- User onboarding flows
- Authentication-related interfaces
- Dashboard interfaces
- Project creation and management flows
- Roadmap and task interfaces
- Progress tracking interfaces
- AI-generated result displays
- Upgrade and checkout interfaces
- Help and support interfaces

- Responsive UI implementation
- Connecting frontend components to backend APIs

The frontend work required handling application state, API responses, loading states, errors, validation, and user-specific project data.

Backend & API Development

I have worked with backend functionality involving:

- REST API integration
- Authentication flows
- Project-scoped API requests
- AI analysis endpoints
- Roadmap-related APIs
- Progress-related APIs
- Help/support functionality
- Checkout and upgrade flows
- Payment verification workflows
- Input validation
- Error handling
- CORS configuration
- Idempotency handling
- Backend testing

A major part of this work involved ensuring that frontend features were connected to the correct backend functionality rather than relying only on frontend state.

AI Integration

Bexra uses AI as part of its entrepreneurship guidance workflow.

I have worked with AI-powered functionality including:

- Connecting application workflows to Gemini APIs
- Sending structured project information for analysis
- Processing AI-generated business outputs
- Integrating AI responses into the product interface
- Testing AI API responses
- Handling AI-related errors and failures

- Validating generated results before presenting them to users

The product direction focuses on turning AI output into structured, actionable founder guidance rather than simply displaying generic chatbot responses.

Project & Roadmap System

I have worked on project-scoped functionality where users can work with their own startup projects.

This includes:

- Project identification
- Project-specific API requests
- Roadmap generation and display
- Project-specific tasks
- Progress tracking
- Redirect and navigation flows
- Validation of project identifiers
- Handling invalid or malformed project IDs

The goal is to ensure that users interact with data belonging to the correct project rather than accidentally mixing information between projects.

Progress Tracking

I worked on functionality related to tracking progress through startup roadmaps.

This included:

- Progress page implementation
- Project-specific progress
- Task completion tracking
- Progress-related API integration
- Navigation and redirect handling
- Validation of project identifiers
- Testing different progress states

Authentication

I have worked with authentication-related application flows, including:

- Login functionality
- Authentication API integration
- User-specific application access
- Authentication error handling
- Protected application workflows

I also worked on testing authentication behavior and debugging issues encountered during development.

Payments & Upgrade Flow

Bexra includes paid functionality and upgrade workflows.

I have worked on:

- Upgrade/checkout interface
- Payment workflow integration
- Razorpay-related integration
- Payment verification flow
- Handling incomplete payment configuration
- Testing payment-related API behavior

Payment verification requires backend validation rather than relying only on frontend confirmation.

API Reliability & Debugging

A significant part of my work has involved debugging real application issues.

Examples include:

- CORS configuration issues
- API request failures
- Authentication issues
- Invalid project IDs
- Missing payment credentials

- AI API failures
- Incorrect API responses
- Frontend/backend integration issues
- Idempotency-related behavior

I have also worked on identifying whether an issue originated in the frontend, backend, database, external API, or configuration.

Testing

I have participated in testing application functionality across multiple areas.

Testing has included:

- Authentication flows
- API responses
- Project-specific functionality
- Progress tracking
- Input validation
- Payment-related workflows
- AI API integration
- Error handling
- Invalid input scenarios
- Backend tests

I also worked with deterministic validation and consistency checks to catch contradictory or invalid application states without unnecessarily making additional AI requests.

Technical Problem Solving

One of the most valuable parts of working on Bexra has been dealing with real product constraints rather than building isolated tutorial projects.

This has involved:

- Debugging production-style issues
- Working with external APIs
- Handling authentication
- Integrating AI services
- Working with databases

- Connecting frontend and backend systems
- Testing edge cases
- Making changes without breaking existing functionality
- Balancing product requirements with technical constraints

What I Learned

Working on Bexra gave me practical experience in:

- Full-stack product development
- AI integration
- REST API architecture
- Authentication
- Database-backed applications
- Payment integration
- API debugging
- Product architecture
- Feature planning
- Testing
- Deployment and production troubleshooting
- Working on a real startup product

This experience also helped me understand the difference between building a standalone project and maintaining a product with multiple interconnected features and dependencies.
